NetWare 6, Support Pack 4 Server Abending

We have recently discovered that after application of NetWare 6, Support Pack 4, NetWare servers will abend when unloading MySQL for NetWare. This issue could be caused if the server is rebooted or MySQL for NetWare is unloaded at the console. Characteristics of this issue are that the server stops responding during reboot, or stops responding after using the unload mysqld command at the server console.

Fix:

If you update your NetWare 6 server to Support Pack 4, you must also upgrade MySQL from version 4.0.13 to 4.0.18. This is a manual file replacement process and was not made automatic, or documented, by Novell. Please contact AEC Customer Support for additional information before you apply Support Pack 4 to NetWare 6. If you have already applied the Support Pack and are experiencing this issue, please contact AEC Customer Support at support@amered.com.
